

Rehab Moncton

Rehab Moncton - EECp therapy is a fairly new outpatient treatment utilized for heart failure and angina. People with heart ailments can find the basic daily activities quite tough. Activities like walking the dog or getting the mail may present some difficulties. If you or perhaps someone you know experiences angina or heart failure, the non-invasive treatment referred to as EECp therapy can be helpful. Statistics show that about 80 percent of patients who complete the 35 hour course of EECp therapy report significant symptom relief which could last as long as 3 years.

EECP therapy has proven to be a helpful treatment utilized for angina and heart failure. Generally, treatments are given for one hour a day, 5 days a week for a total of 35 hours. A treatment session comprises lying on a comfortable treatment table with big blood pressure like cuffs wrapped all-around your buttocks and your legs. At specific times in between your heartbeats, these cuffs deflate and inflate. A continuous ECG or electro cardiogram is used to set the timing. This insures that the cuffs inflate while the heart is in its resting condition where it normally receives its supply of oxygen and blood. Afterward the cuffs deflate at the end of that rest period, just prior to the next heartbeat. The individual wears a special sensor on their finger to be able to check the oxygen levels in their blood. The sensor also checks the pressure waves created by the cuff deflations and inflations.
